## EXPERIENCE

Software Engineer
Apollo Global Wealth Management, 2026 - Present

- Re-architect our backend workflow orchestration by migrating from Dagster to Temporal, significantly improving reliability and fault tolerance of core data pipelines
- Engineer scalable ETL pipelines using Snowflake, transforming complex financial data into MongoDB documents to power a real-time Vue-based cash ladder application
- Develop intelligent automation tools by building Claude-powered agentic workflows and automated GitHub CI/CD pipelines to streamline development and deployment cycles

Software Engineer
Raytheon Technologies, 2023 - 2025

- Developed software components using the C++ and Python programming language, creating microservices to accomplish requirements, build internal tools (APIs, PyQt GUIs), and optimizations for physical hardware
- Created a comprehensive SDK for real-time data translation, integrating Redis for intermediate storage and built custom sender/receiver modules to facilitate communication across several messaging environments
- Built containerized simulation systems using Docker/Podman and virtual machines using Python, React (TypeScript), and networking tools on Linux (Red Hat) to streamline integration testing and to test new features
- Served as scrum master for 2 cross-functional teams, facilitating daily stand up meetings and enhancing velocity, such that my team was recognized 3 concurrent quarters for delivering high-demand features

Software Engineer Intern
Raytheon Technologies, 2022 - 2023

- Developed a machine learning model in Python using Scikit-learn, Pandas, and NumPy to predict hardware failures from binary flight instrumentation data from a large test data set of over 1000 flights
- Automated process of cleaning data by handling missing data from signals and outliers in critical data points using Python Pandas DataFrame objects, resulting in a more efficient implementation
- Enabled proactive (and preventative) maintenance and reduced unplanned downtime by forecasting failure patterns, minimizing operational costs and improving system and mission reliability
- Lead a team of 3 throughout the full development process, coordinating project tasks, managing timelines, and ensuring requirements were met

Full Stack Software Engineer Intern
AIT Engineering, 2021 - 2022

- Implemented and maintained React UI components in TypeScript to build a high-throughput web application that received data from a variety of sources (user interaction, GPS devices, and simulated events)

- Developed Java microservices to accomplish requirements, with a required 75% unit test code coverage using JUnit
- Engineered a critical data delivery bug involving PostgreSQL and ActiveMQ within the microservices platform, ultimately facilitating reliable data flow and boosting application stability

## EDUCATION

Bachelor of Science (B.S.): Computer Science
University of Florida, Gainesville, Florida, Aug 2023
Bachelor of Science (B.S.): Business Administration
University of Central Florida, Orlando, Florida, Aug 2018

## CERTIFICATIONS

Certified Cloud Practitioner, Amazon Web Services (AWS), October 2024

- Earned AWS certification demonstrating fundamental knowledge of AWS cloud services, architecture, and best practices
